1 The Problem We Are Trying to Solve

2 Using the Resource Manager

3 Understanding Resource Management

◆□ ▶ ◆■ ▶ ◆ ■ ▶ ◆ ■ ● ● ● ●

The User's Problem

have dedicated resources multitasking is Bad for HPC

- have resources as soon as possible you need to have your computation done by next week, right?
- have jobs run unattended and results delivered back to you what do you want to do at 4.30AM?

◆□▶ ◆□▶ ◆□▶ ◆□▶ ▲□ ◆ ○○

A job script contains a description of the resources you request and all the commands your job needs to perform. Resource description always comes at the beginning of the script and is identified by the **#PBS** mark.

```
#!/bin/sh
#PBS -1 walltime=1:00:00
#PBS -1 nodes=1:ppn=2
#PBS -N MyTestJob
do_something_useful
do_more
exit 0
```

◆□▶ ◆□▶ ◆□▶ ◆□▶ ▲□ ◆ ○○

A job script contains a description of the resources you request and all the commands your job needs to perform. Resource description always comes at the beginning of the script and is identified by the **#PBS** mark.

```
#!/bin/sh
#PBS -1 walltime=1:00:00
#PBS -1 nodes=1:ppn=2
#PBS -N MyTestJob
do_something_useful
do_more
exit 0
```

A job script contains a description of the resources you request and all the commands your job needs to perform. Resource description always comes at the beginning of the script and is identified by the **#PBS** mark.

```
#!/bin/sh
#PBS -1 walltime=1:00:00
#PBS -1 nodes=1:ppn=2
#PBS -N MyTestJob
do_something_useful
do_more
exit 0
```

Jobs are submitted to the batch system by means of the ${\tt qsub}$ command, as in

qsub job.sh

But you can also add resource description directly on the command line:

qsub -l nodes=4:ppn=4 job.sh

This is especially useful when you are experimenting with subtle variations of a job submission.

Jobs are submitted to the batch system by means of the qsub command, as in

qsub job.sh

But you can also add resource description directly on the command line:

```
qsub -l nodes=4:ppn=4 job.sh
```

This is especially useful when you are experimenting with subtle variations of a job submission.

Batch systems are usually configured with multiple queues. Each queue can be configured to accept job from a certain group of users, or within specified resource limits, or simply on request from the user.

Be sure to select the right queue for your jobs.

Queue selection is performed with -q queuename on the qsub command line or with #PBS -q queuename in the job script.

Batch systems are usually configured with multiple queues. Each queue can be configured to accept job from a certain group of users, or within specified resource limits, or simply on request from the user.

Be sure to select the right queue for your jobs.

Queue selection is performed with -q queuename on the qsub command line or with #PBS -q queuename in the job script.

Simple Resource Specification

request *n* execution nodes -l nodes=n

request *n* execution nodes -1 nodes=n-l nodes=n:ppn=m request *n* execution nodes with m CPUs each

request *n* execution nodes -l nodes=n -l nodes=n:ppn=m request *n* execution nodes with m CPUs each request n seconds of wallclock time -1 walltime=n(walltime can be specified also as hours:minutes:seconds)

request *n* execution nodes -l nodes=n -l nodes=*n*:ppn=*m* request *n* execution nodes with m CPUs each request n seconds of wallclock time -1 walltime=n(walltime can be specified also as hours:minutes:seconds) -1 nodes=*n*: feature request n nodes with a specific feature e.g. we use :myri for nodes with Myrinet cards

request *n* execution nodes -l nodes=*n* -l nodes=n:ppn=m request *n* execution nodes with m CPUs each request n seconds of wallclock time -1 walltime=n(walltime can be specified also as hours:minutes:seconds) -1 nodes=*n*: feature request n nodes with a specific feature e.g. we use :myri for nodes with Myrinet cards submit job to named queue -q name

-l nodes= <i>n</i>	request <i>n</i> execution nodes
-1 nodes= <i>n</i> :ppn= <i>m</i>	request <i>n</i> execution nodes
	with <i>m</i> CPUs each
-l walltime=n	request <i>n</i> seconds of wallclock time
	(walltime can be specified also
	as hours:minutes:seconds)
-1 nodes=n:feature	request <i>n</i> nodes with a specific feature
	e.g. we use :myri
	for nodes with Myrinet cards
-q name	submit job to named queue
-N name	give job a name

If resources are available right now you can run interactive jobs with qsub -I

In an interactive job you are given a shell on a computing node and are allowed to execute all your computation interactively, possibly on several nodes.

(日) (日) (日) (日) (日) (日) (日)

```
masternode $ qsub -I -q smp -l walltime=5:00 -l
nodes=1:ppn=2
qsub: job 29506.cerbero.hpc.sissa.it ready
```

a211 \$

◆□▶ ◆□▶ ▲□▶ ▲□▶ ▲□ ◆ ○○

Node Access and Resource Limit Enforcement

- access right is granted only to nodes allocated to your job this enforces the limit on the number of nodes you can access and guarantees that no concurrent usage of a resource is possible
- access right is granted only for the walltime allocated to your job

when your allocated walltime expires, you are given a short *grace time*, then all your processes on the computing node are killed

you should arrange so that your jobs completes before the walltime limit, or save partial results before the job is killed

Node Access and Resource Limit Enforcement

The Maui Scheduler prioritizes jobs in the idle queue, according to admin-defined policies. The highest-priority job is run as soon as resources are available.

Jobs can be blocked if their requirements exceed available resources. Blocked jobs have an undefined priority.

Job priorities are recomputed at each scheduler iteration, so your job can move up and down the idle queue as an effect of resource usage by other jobs of yours.
