<b>Principal Investigator name:</b>	Dr. Matteo Viel
<b>Host Institution name:</b>	ISTITUTO NAZIONALE DI ASTROFISICA
<b>Date of submission:</b>	

## Final Activity Report

### Summary of the major project achievements over the entire lifetime of the project

The information provided in this section will only be available to ERC staff, to members of the ERC panels, and to the Scientific Council

Explain in a clear manner the work performed during the entire lifetime of the project along the main objectives/activities of the project listed in the Description of Work (DoW). Please indicate the publications linked to these objectives/activities.

Please specify the outcome in terms of:

- research and technological achievements along the main objectives/activities (in line with the DoW)

The research themes exploited by the cosmoIGM project have fully followed the three main research areas that were outlined in the DOW document: 1) IGM and the large scale structure of the Universe; 2) IGM and fundamental physics; 3) IGM/galaxy interplay.

I will now outline the main scientific achievements that have been reached in all these three sub-areas.

IGM and the large scale structure of the Universe. The main goal of this topic was to further establish the unique role of the IGM as a tracer of the underlying density field by exploiting new data and by interpreting them with state-of-the-art hydrodynamical simulations. The cosmoIGM has analysed data sets at low, medium and high resolution from different spectrographs (SDSS-III/BOSS, X-Shooter – see Irsic, Viel et al. 2016, MNRAS, in press -- UVES/VLT and KECK/HIRES and MIKE instruments) carefully addressing how the properties of transmitted flux in the Lyman-alpha forest are related to the matter distributions by means of either numerical hydro simulations or mock data sets. The main results are: the full characterization of the 3D and 1D flux power in hydro simulations with fitting functions that have been used by the SDSS-III/BOSS collaboration in the measurement of Baryonic Acoustic Oscillations (Arinyo-i-Prats et al. 2015, JCAP, 12, 017); setup of hydro simulations to interpret the 1D flux power within the BOSS collaboration (Palanque-Delabrouille et al. 2015a,b; Rossi et al. 2015); the important synergies between intensity mapping experiments and the Lyman-alpha forest and the use of intensity mapping as a cosmological probe (Villaescusa-Navarro, Viel et al. 2014, JCAP, 09, 050); novel characterization of the cross-correlation signal between the unresolved Fermi gamma ray background and large scale structure data sets at high and low redshift that in turns allows to place constraints on the contribution of astrophysical sources to the background (Cuoco et al. 2015, ApJS, 221, 2).

IGM and fundamental physics. The main goal of this sub-topic was to see to what extent IGM structures can probe fundamental physical properties of the Universe, more importantly neutrino masses and the nature of the dark matter. In order to address this topic was necessary to develop and test hydrodynamical codes and codes that simulate warm dark matter (instead of cold) to unprecedented precision and accuracy, in a fully non-linear regime which is probed by IGM structures. To date, the cosmoIGM team has produced the tightest limits on the cold dark matter coldness (using medium resolution and high resolution spectra) – Viel et al. 2013, Physical Review D, 88, 3502; Irsic, Viel et al. 2017a submitted to Physical Review D; Irsic et al. 2017b submitted to Physical Review Letters -- and on total neutrino mass (within the SDSS-III/BOSS collaboration: Palanque-Delabrouille et al. 2015, JCAP, 02, 045; Palanque-Delabrouille et al. 2015, 11, 11). IGM data have also provided limits on dark energy and modified gravity behaviour in the high redshift universe (Baldi et al. 2014, MNRAS, 440, 1; Peirone et al. 2017, Physical Review D, in press). Cross-correlations studies at small angular scales between the Fermi unresolved extragalactic gamma

ray background and different surveys have also provided tight limits on decaying dark matter and supersymmetry models (Regis et al. 2014, Physical Review Letters, 114, 241301).

IGM/galaxy interplay. The main goal of this sub-topic was to analyse the intimate relation between gaseous matter around galaxies and the properties of galaxies themselves. The cosmoIGM team has performed hydrodynamical simulations of structure formation with a suitable ad-hoc modification of a public available code in order to implement various recipes of galactic feedback. Investigation of the impact of galactic feedback on several Lyman-alpha forest properties at low and high redshift has been analysed in the following papers under the theoretical/numerical point of view: Viel et al. 2013, 429, 1734; Bolton et al., 2017, MNRAS, 464, 897; Viel et al. 2017, MNRAS Letters in press; Barai et al. 2015, MNRAS, 447, 1. The main result is that constraints on some feedback mechanisms have been placed and the impact on neutral hydrogen and metal line statistics has also been addressed: galactic outflows to remove metals from the innermost parts of galaxies and enrich the medium, physical properties of galaxies (e.g. star formation) are also influenced by feedback mechanisms (Barai et al. 2012, 2013, 2015). Under the observational point of view, metal enrichment investigations of the IGM have been made with X-Shooter (D'Odorico et al. 2013, 435, 2) or with high-resolution spectra UVES (e.g. Kim et al. 2016, MNRAS, 457, 2).

#### - novel and/or unconventional methodologies

The novelty of the methodologies used can be summarized as follows: i) dealing with non-linearities using state-of-the-art modifications of public available codes in particular for neutrinos and warm dark matter simulations; ii) addressing the role of feedback by implementation of new astrophysical processes (winds and or other forms of galactic feedback) in hydrodynamical simulations by modifications of numerical codes; iii) full analysis of spectra at high, medium and low resolution in a comprehensive way in order to highlight different systematics and how they impact on physical observables; iv) providing a clear methodology of model comparison for particle physics models (fuzzy dark matter, sterile neutrinos, mixed hot/cold models) by addressing their impact on cosmological structures at small scales; v) new methodology and techniques exploited in the analysis of cross-correlations between the Fermi unresolved gamma-ray background and large scale structure tracers in order to probe the nature of dark matter; vi) realization of mock quasar spectra sample that contains all the relevant systematics, statistical and physical treatment of the different effects that impact on Lyman-alpha forest flux statistics (more importantly 1D flux power).

#### - inter and cross disciplinary developments

The cosmoIGM proposal is clearly inter-disciplinary. The most important synergy is between particle physics and cosmology.

The limits the team cosmoIGM has provided in terms of cold dark matter coldness and neutrino masses have triggered the interest of particle physics community that is either looking at dark matter candidates or aiming at measuring the neutrino masses.

Since these limits and numbers depend also on astrophysical quantities (e.g. galactic feedback) it was necessary to exploit also the important synergies between galaxy formation and cosmology and carefully address the role of astrophysical quantities on the cosmological quantities we aimed at measuring. This second aspect has allowed a fruitful interaction with galaxy formation experts that has lead to several publications (e.g. Viel et al. 2017, MNRAS Letters in press; Villaescusa-Navarro et al. 2016, MNRAS, 456, 14).

To summarise, the inter-disciplinary nature of the proposal has been fully exploited with the important synergies between cosmology and particle physics and cosmology with galaxy formation/astrophysics. Under the methodological point of view the proposal has dealt with different tools that went from data reduction, theoretical modeling, numerical modeling and phenomenological

exploitation of the models with data comparison.

- knowledge and technology transfer

The dissemination and transfer of knowledge was organized through periodic meetings held between the cosmoIGM team members and/or in a wider environment with other researchers working on similar topics. More than 100 publications have been published in peer-reviewed journals with high impact factor ( $>4.5$ ) and are listed in the publication list below. This amounts to about 20 publications/year which is a remarkable achievement.

- enhancing the immediate research environment

The research environment was ideal for performing science related on the IGM. The team has interacted fruitfully with the researchers of INAF/OATS and with other colleagues in international institutions. Group meetings on IGM topics were organized and also collaborative meetings with speakers and/or colleagues visiting INAF/OATS. The Trieste research area (SISSA, ICTP and Trieste University) have also provided the opportunities for important collaborations and for talks/seminars/workshop where presenting the results.

- establishment and/or consolidation of the research group and team composition

The team was composed by 5 members: the PI and 4 postdoctoral fellows with complementary expertise in the 3 sub-topics addressed by the proposal.

The fellows had however different scientific and social backgrounds. However, it was easy to setup the team and make the fellows interact with themselves and with other researchers. Their Phd was nevertheless done in international top-institution so they did not have any problem in interacting and consolidating their expertise in the OATS INAF environment.

- others

No other issues to be reported. Please note that there are 2 papers still to be submitted that contain the exploitation of the cosmological relevance of the X-Shooter data set (medium resolution spectroscopy) in terms of dark matter candidates and cosmological/astrophysical parameters.

## Publishable brief summary of the achievement of the project

This section, which should not exceed 1 page (approx. 600 words), might be used for dissemination of the project progress/results to the general public/scientific community. For this reason, please do not reproduce here the project abstract, which is already available in CORDIS.

### Stand alone description of the project and its outcomes

The cosmoIGM team has addressed the role of matter between galaxies (the IGM) as a cosmological tracer of the underlying large scale structure and as a probe of fundamental physics. Usually, matter between galaxies does not shine, it is a diffuse low density medium which contains gaseous material and dark matter. It can be probed using the light emitted by distance sources (quasars) and by carefully analyzing the cosmic journey of the photons traveling through the intergalactic medium and reaching the telescopes. On the theoretical side, time consuming super computer simulations of the Universe are made in order to compare data with a given model. The team has placed important constraints on the behavior of dark matter at small scales and on the total mass of neutrino particles in the Universe: to date these are the tightest constraints that cosmology could offer and are of course of fundamental importance for particle physics experiments. The team has also made a comprehensive analysis of data at low, high and medium resolution and constrained physical and chemical properties of the IGM and the intimate relation that exists between the IGM and the galaxies.

The intergalactic medium is a powerful and new cosmological tool that can address fundamental physical questions and aspects related to the formation of galaxies. The cosmoIGM team was composed by 5 members of different nationalities: the PI, Prof. Matteo Viel from Italy; Dr. Barai from India; Dr. Villaescusa-Navarro from Spain; Dr. Enea Di Dio from Switzerland; Dr. Tae-Sun Kim from South Korea. The unique international environment offered by Trieste Observatory has allowed the researchers to progress further in their career and they are now conducting research in other top-level internationally recognized institutions.

## Overall assessment of the achievements and success of the project

The information provided in this section will only be available to ERC staff, to members of the ERC panels, and to the Scientific Council

### To what extent have you achieved your objectives?

I am very happy about the outcome of the cosmoIGM research. I believe we did extremely well in all the areas and objectives were fully reached.

There have been some topics on which I recognized we could have had a stronger impact. For example, I entered the BOSS/SDSS-III collaboration when the collaboration was already started and it was a bit difficult for me to lead a given project so I decided to collaborate on important topics rather than leading a new research activity. At the same level, forecasting science for E-ELT spectrographs could have been performed more intensively.

On the other hand there have also been unexpected areas in which we made great progress, like the characterization of neutral hydrogen also in intensity mapping and the synergies between absorption and emission studies in view of future experiments like SKA.

However, the small drawbacks did not impact on the final high quality scientific outputs of the cosmoIGM science and the objectives are fully reached.

### What are the most important conclusions of your research?

The most important conclusions of my research and my most successful findings are the tight constraints that myself and the cosmoIGM team have provided in terms of coldness of cold dark matter (Viel et al. 2013; Irsic, Viel et al. 2017) and on the total neutrino mass (Palanque-Delabrouille et al. 2015). Furthermore, neutrino non-linearities have been exploited at an unprecedented level of precision by using a state-of-the art code (Viel, Hahnelt and Springel 2010; Villaescusa-Navarro, Viel et al. 2014).

A full and comprehensive analysis of the statistical properties of transmitted Lyman-alpha forest flux and the interpretation of cosmological and astrophysical parameter is also an important result. This has also allowed to constrain the thermal state of the intergalactic medium by using data at low, high and medium resolutions from 5 different spectrographs (BOSS, HIRES and UVES and MIKE, Shooter).

First attempt made to provide a characterization of neutral hydrogen in absorption and emission using intensity mapping and absorption lines from  $z=0$  to high redshift with forecasts for SKA and future data sets.

### To what extent have you gone beyond the state of the art?

The modeling of non-linearities which was allowed by using the codes dealing with neutrinos and the exploration of beyond standard model cosmologies by using IGM data and more importantly the 1D flux power has allowed to make great progress in the field. The modeling and constraints provided by high-redshift data in terms of cosmological and astrophysical parameters has also allowed to enter a new more mature regime for which IGM data are more reliable and offer unique opportunities to perform quantitative studies.

### What is the impact of the project (within the scientific community and on society)?

The project has been very prolific in terms of publications: there are 108 publications that were published in peer-review journals by the cosmoIGM team members, some other publications not peer-reviewed are not in the publication list. Few publications are now submitted to Journals and will

be uploaded soon. There have also been several participations to conferences and collaboration meetings where presentations about cosmoIGM activities were given. The PI was also invited to important conferences as a plenary speaker. Outreach activities were performed (see below). Overall in terms of scientific productivity and impact of the results on the community I regard this project as very successful.

How effectively has the project helped you start or consolidate your research group? (for Starting Grants/Consolidators Grants only)

The project has clearly allowed me to reach a more mature level in my career and become more independent. After the grant was finished I changed host institution and became Associate Professor. The grant was clearly helpful in obtaining this promotion.

How well have you been supported by your Host Institution?

Extremely well, both under the scientific and administrative point of view.

What difference did the ERC make?

A great difference. In a situation in which there was shortage of money for research it was very helpful for conducting my studies and for supporting with competitive salaries the international researchers of the team. On top of that the University at some point has had the possibility of hiring ERC winners as Associate Professor. This is how I got promoted on 01/12/2016 as an Associate Professor at SISSA University.

**How many people completed a PhD in the framework of the project?**

0

**Comments:**

My cosmoIGM team was made of postdocs. During the grant I have supervised 4 PhD students that have successfully finished the PhD program but they were not paid by the cosmoIGM grant.

**How many people started a PhD in the framework of the project?**

5

**Comments:**

However, the students were not paid by cosmoIGM grant money.

## A2. Research expeditions

List of expeditions

Period (start-end)	Place	Purpose
--------------------	-------	---------

## A3. Awards and recognitions

List of awards and recognitions

Award type	Title of the award	Person to whom the award was made	Year	Short description of the reason the award was made (if applicable)	Any further information / clarification
------------	--------------------	-----------------------------------	------	--	---

## A4. Patents, licensing, intellectual property

List of patents, licensing, intellectual property

Type of IP Rights	Confidential	Foreseen embargo date dd/mm/yyyy	Application reference(s) (e.g. EP123456)	Subject or title of application	Applicant(s) (as on the application)
-------------------	--------------	----------------------------------	--	---------------------------------	--------------------------------------

## A5. Dissemination to non-academic audience

List of disseminations

No.	Type of activities	Main Leader	Title	Date	Place	Type of audience	Size of audience	Countries addressed
1	Other forms of dissemination	ISTITUTO NAZIONALE DI ASTROFISICA	COSMOLOGIA MODERNA TRA LUCE ED OMBRA	08/05/2012	Collegio Universitario Gregorianum - Padova - Italy	Scientific community (higher education, Research)	80	Italy
2	Presentations	ISTITUTO NAZIONALE DI ASTROFISICA	Cosmologia a Trieste	05/09/2013	Dipartimento di Astronomia e Osservatorio Astronomico di Trieste	Scientific community (higher education, Research)	40	Italy
3	Media briefings	ISTITUTO NAZIONALE DI ASTROFISICA	Il mezzo intergalattico - La scienza del futuro	27/09/2013	Trieste Next - Teatro Verdi	Scientific community (higher education, Research) - Civil society - Medias	200	Italy
4	Presentations	ISTITUTO NAZIONALE DI ASTROFISICA	Tre cose assolutamente da sapere sull'Universo in cui viviamo	07/07/2015	Sexten Center for Astrophysics	Civil society	50	Italy-Austria

12	Presentations	ISTITUTO NAZIONALE DI ASTROFISICA	Cosmologia moderna	10/02/2012	Conferenza presso Liceo Scientifico G. Marinelli Udine	Scientific community (higher education, Research)	100	Italy

## A6. Other significant outputs / information

Information on other important outputs which have arisen - wholly or partly - from this project.

(Only for ERC projects selected from the 2012 and 2013 calls for proposals)

This grant agreement includes special clause 39, requiring you to make best efforts towards open access to publications resulting from this project. Should, despite your best efforts, not all publications be available in open access, please give reasons why this is the case.
